

Abstract

Conception Phase

In this phase, I tried to represent the most essential part of the design process. Firstly, I created a written concept that describes features that should be needed to build a habit-tracker. In this written concept, I explained the technical basics by illustrating it in a diagram.

Development Phase

An explanation of my concept and the implementation process is presented at this stage in the form of a composite PDF presentation with 10 slides. The document is organized, contains graphical components that make it easier to understand, and describes the tools I have chosen to use. I considered this presentation as a client-oriented document, as opposed to the internal design document that I prepared at the first stage.

Finalization phase

In this phase, I completed the coding part of my project. In addition, I wrote well-detailed documentation. Then I created a public repository on Github and uploaded the final project with a good ReadMe.md file.
